Algebra 1: Unit 5, Lesson 10

1. A system of equations is shown.

$$\begin{cases} -2x - 4y = -48 \\ x + 4y = -20 \end{cases}$$

Add the two equations together to solve for x.

2. A system of equations is shown.

$$\begin{cases} -2x - 2y = 20 \\ x - 7y = 14 \end{cases}$$

To solve the system of equations by eliminating the x-values, multiply $x - 7y = 14$ by what integer?

3. The solution to the system of equations, $\begin{cases} -5x + 2y = 11 \\ -3x + 4y = -13 \end{cases}$, is the coordinate, $(-5, y)$. What is the y-value of the solution?
