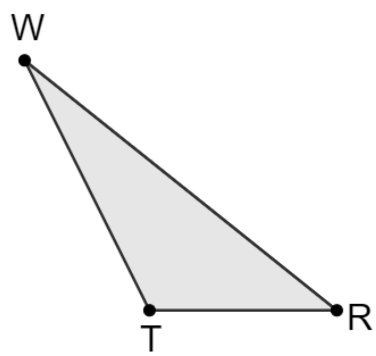
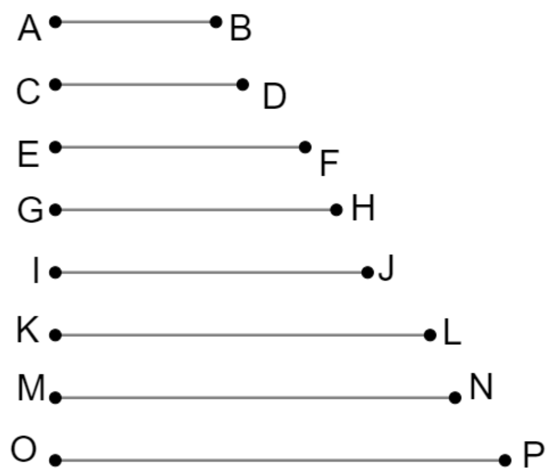
Geometry Name____________________
Unit 5 Date____________________
Lesson 1 Practice Period___________________

Triangle WRT and 8 line segments are shown.





Use patty paper, a ruler, or edge of a piece of paper to determine which line segments have the same measure as each side of triangle WRT.

Complete each.

1. $WT =$ ________

2. $RT =$ ________

3. $WR =$ ________

4. Construct a triangle using the line segments that have the same measure as each side of triangle WRT. Name the new triangle XYZ.

5. Complete the statement.

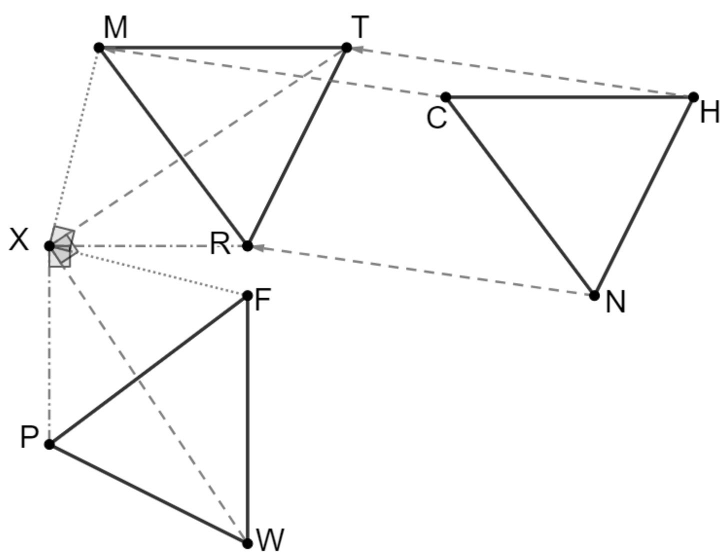
The three sides of triangle WRT are congruent to the three sides of triangle XYZ because $WT =$
- o XY,
- o YZ,
- o XZ,

$RT =$
- o XY,
- o YZ,
- o XZ,

and $WR =$
- o XY.
- o YZ.
- o XZ.

6. Determine if the angles of $\triangle WRT$ and $\triangle XYZ$ are congruent. Explain how you determined your answer.

A series of transformations were applied to $\overline{CH}$, $\overline{HN}$, and $\overline{NC}$.



Complete the statements.

7. The first transformation applied to $\overline{CH}$, $\overline{HN}$, and $\overline{NC}$ is ________________. This results in $CH =$ ________, $HN =$ ________ and $NC =$ ________.

8. Therefore, by the definition of _______________________, $\triangle HNC \cong \triangle TRM$.

9. The second transformation applied to $\overline{MR}$, $\overline{RT}$, and $\overline{TM}$ is _____________. This results in $MR =$ ________, $RT =$ ________ and $TM =$ ________.

10. Therefore, by the definition of __________________________, $\triangle TRM \cong \triangle$ ________.
