Grade 6
Unit 1
Lesson 1 Practice

Name____ Answer Key_______
Date_______________________
Period_____________________

Use the following context to answer questions 1 - 5.

The protein bar manufacturer decided to package and sell mini versions of their signature protein bar for kids. Each 12-pack of mini-sized bars will be sold for $\$3$.

1. Complete the table.

Mini Protein Bars	Cost ($)
12	$3
24	$6
36	$9
48	$12

2. Write an equation to represent the relationship between the number of mini protein bar containers, x, and the cost in dollars, y.

$y = \frac{1}{4}x$ or $y = x \div 4$

3. What is the cost of 60 mini protein bars?

$y = 60 \div 4$
$y = 15$

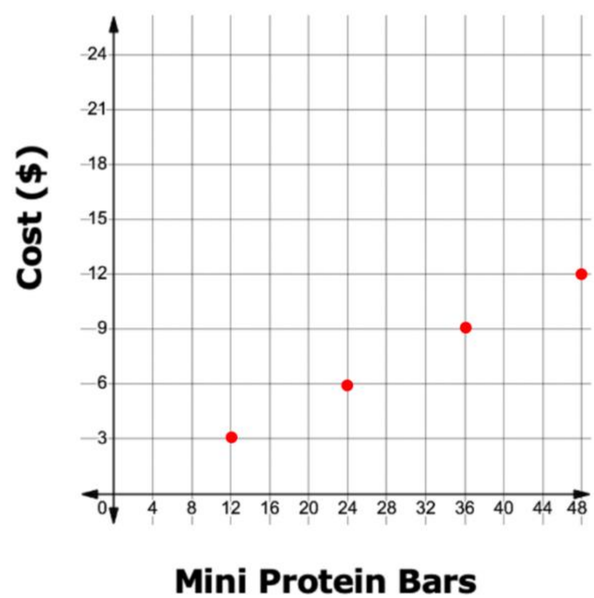
60 mini protein bars cost $\$15$.

4. How many mini protein bars would $\$24$ buy?

$y = x \div 4$
$24 = x \div 4$
$\cdot 4. \qquad \cdot 4$
$96 = x$

$\$24$ would buy 96 protein bars.

5. Use the coordinate grid to plot the ordered pairs in the table from question 1.



Use the following context to answer questions 6 - 10.

A team of mathematicians at an apple juice manufacturer is collecting information on how many apples are needed to make small cartons of apple juice.

The table shows the information the mathematicians have recorded so far.

Small Cartons of Apple Juice	Average Number of Apples Needed
5	60
6	72
8	96

6. Write an equation that represents the relationship between the number of small cartons of apple juice, x, and y, the average number of apples needed.
   $y = 12x$

7. What is the average number of apples needed to make 7 small cartons of apple juice?
   $y = 12x$
   $y = 12 \cdot 7$
   $y = 84$ apples

8. The average apple tree produces between 180 and 300 apples. What is the range of the number of small cartons of apple juice that can be made using apples from the average apple tree?

   $y = 12x$
   $180 \div 12 = 12x \div 12$
   $15 = x$

   $y = 12x$
   $300 \div 12 = 12x \div 12$
   $25 = x$

   Range: $15 - 25$ cartons

9. Use the table or equation to complete the ordered pair.

   $y = 12x$
   $y = 12 \cdot 10$
   $y = 120$

   $(10, 120)$

10. How many small cartons of apple juice can be made from 24 apples?

    $y = 12x$
    $\frac{24}{12} = \frac{12}{12}$
    $2 = x$

    2 small cartons can be made from 24 apples.
