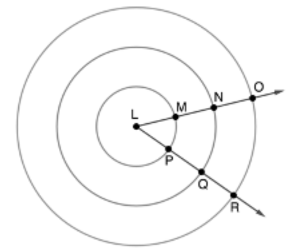
Geometry
Unit 10
Lesson 3 Practice

Name___Answer Key______
Date___________________
Period__________________

For questions 1-6, concentric circles with center L are shown. Points M and P lay on the innermost Circle L, and has radius $LM = 3$ units. Points N and Q lay on the middle Circle L, and has radius $LN = 6$ units. Points O and R lay on the outer Circle L, and has radius $LO = 9$ units.



Determine the circumference for each circle. Leave your answer in terms of π.

	Circle	Circumference
1.	Innermost Circle	6π
2.	Middle Circle	12π
3.	Outer Circle	18π

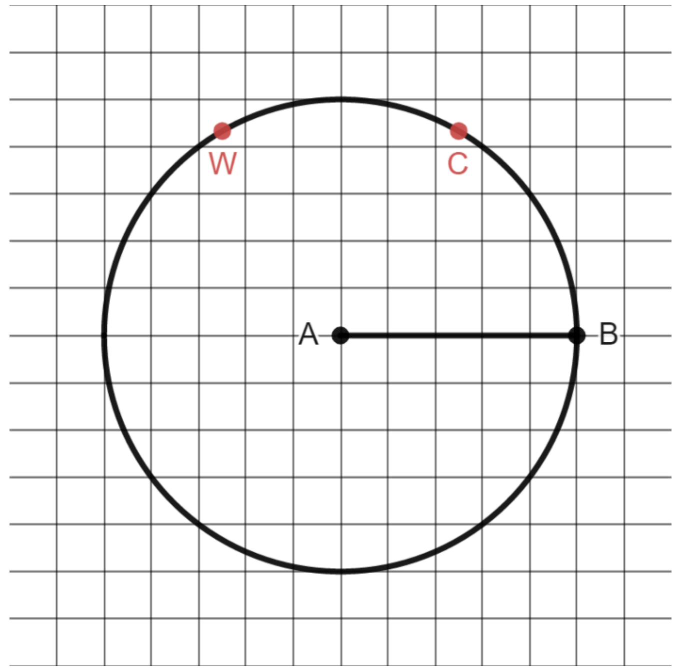
Complete the table.

	Circle	Ratio of Circumference to Radius
4.	Innermost Circle	$\frac{6\pi}{3} = 2\pi$
5.	Middle Circle	$\frac{12\pi}{6} = 2\pi$
6.	Outer Circle	$\frac{18\pi}{9} = 2\pi$

7. What would be the ratio of the circumference to the radius for a circle whose center is W and whose radius has a measurement of 16?

$\frac{32\pi}{16} = 2\pi$

Circle A is shown where $\overline{AB}$ is a radius.



8. Label point C on the circumference of circle A so that the resulting arc has an approximate length of 1 radius.
See grid.

9. Describe how you determined the location of point C.
Answers may vary. Example answer: I measured the length of the radius and measured that length on the circle.

10. Label point W on the circumference of circle A so that the resulting arc has an approximate length of 2 radii.
See grid.
