A table representing gasoline prices per gallon at one gas station is shown.

Gas (gallons)	Price (dollars)
$\frac{1}{2}$	$1.56
10	$31.20
3	$9.36
17	$53.04

Use the table for questions 1 through 5.

1. A truck that holds _24_ gallons of gas will pay $74.88.

   1) $\frac{31.20}{10} = \frac{3.12}{1}$ 2) $\frac{74.88}{3.12}$

2. A push mower typically uses 2 gallons of gas, which will cost _$6.24__ to fill up the tank.

   2(3.12)

3. The road trip from Orlando, FL to St. Louis was 1008 miles. If the automobile got 24 miles per gallon on the trip, [○ 42 / ○ 24] gallons of gas was needed at a cost of [○ $131.04 / ○ $74.88].

   $\frac{1008}{24} = 42$ gallons 42(3.12)

4. One unit, or gallon, of gas to its cost can be written as 1: $3.12_.

5. The gas station down the street has a unit rate of $\frac{1}{\$3.09}$. That station has an [○ increased / ○ decreased] unit rate than the station represented by the table.

The Shine Central Car Wash has an Ultimate Car Wash that uses 3L of soap and 1.5L of wax for every wash.

$3L$ | $1.5L$ | 1

Soap	Wax	Car Washes
21L	10.5L	7
$83(3)$ 249L	124.5L $\frac{}{1.5}$	83
36L $\frac{36}{3}$	$12(1.5)$ 18L	12

6. Complete the table that represents the amount of soap and wax used for the Ultimate Car Wash.

7. What is the unit rate of wax to every car wash?

$\frac{1.5\ L}{1\ car}$ or $1.5{:}1$

8. The ratio of soap to wax for 12 car washes is __36_:_18__.

9. The liters of wax needed for a day of ○ 53 ○ 26 Ultimate Car Washes is ○ 79.5 ○ 159 .

$53(1.5) = 79.5$

10. A delivery of 1,650 liters of soap was just made to the Shine Central Car Wash. That is enough soap for _550_ ultimate car washes. They will need ○ 825 ○ 750 liters of wax to match that number of washes.

$\frac{1650\ soap}{3\ soap} = 550$ $550(1.5) = 825$
