Algebra 1 | Name Answer Key ____________
Unit 1 | Date____________________
Lesson 3 Homework | Period___________________

The function $C(t) = 25.50t - 16.75$ represents the cost of buying a certain number of tickets to the concert with a $\$16.75$ coupon. The cost, C, is measured in dollars for t tickets.

1. Find the value of $C(4)$.
$c(4) = 25.50(4) - 16.75$
$= 102 - 16.75 = \$82.25$

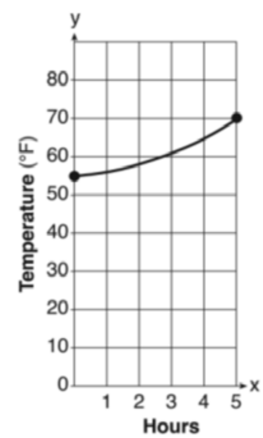
2. What does $C(4)$ represent in the context of the problem?
The cost for 4 tickets.

3. Is the value of $C(6.5)$ reasonable to interpret in the context of the problem?
Not reasonable for there's no half (0.5) of a ticket.

A function $T(h)$ is modeled in the graph below. It shows the temperature in Miami, Florida, where T is the temperature and h is the number of hours since 7 A.M.

4. Find the approximate value of the graph for $T(1)$.

$T(1) \approx 56°\text{F}$



5. What does $T(1)$ mean in the context of the problem?
The temperature during 8 A.M.

6. At what time is the temperature 70°F?
12 noon

7. Why does it make sense that $T(4) > T(2)$ in this context?
Temperature is higher at 11 A.M. than 9 A.M.

The table below represents the number of new homes available in Broward County and the sale prices, in thousands of dollars in 2021.

Sale Price, p (in thousands of dollars)	200	240	280	320	360	400
Number of New Homes Available, $n(p)$	112	105	87	62	31	25

8. Explain the meaning of $n(0) = 0$.
There is a zero sale price because there are no new homes available.

9. Determine the value of $n(320)$.
62 homes

10. Interpret $n(320)$ for the given context.
There will be 62 new homes available if the sale price is $\$320{,}000$.
