Grade 6
Unit 3
Lesson 8 Practice

Name__Answer Key________
Date____________________
Period__________________

1. Samira just started training for a marathon. Each week, she does three $2\frac{3}{4}$-mile runs and one $6\frac{1}{3}$-mile run. If she continues this training plan for 4 weeks, how many total miles will she have run during that time?

$4\left[\left(3\times 2\frac{3}{4}\right)+6\frac{1}{3}\right]\rightarrow 4\left(\frac{33}{4}+\frac{19}{3}\right)=\frac{4}{1}\left(\frac{175}{12}\right)=\frac{175}{3}$ or $58\frac{1}{3}$ miles

2. Suppose the fifth week, Samira increases her mileage and does three $3\frac{1}{3}$-mile runs and one $7\frac{1}{2}$-mile run. What will be her total miles run over the first 5 weeks?

$3\left(3\frac{1}{3}\right)+7\frac{1}{2}=\frac{30}{3}+\frac{15}{2}=\frac{60}{6}+\frac{45}{6}=\frac{105}{6}=17\frac{1}{2}$ $\quad 17\frac{1}{2}+58\frac{1}{3}=17\frac{3}{6}+58\frac{2}{6}=75\frac{5}{6}$ miles

3. Alexis is making Bolognese sauce. She bought 0.85 pounds of ground beef for $\$5.60$ per pound and 1 can of tomatoes for $\$1.79$. If she had a coupon for $\$1.50$ off, how much did she spend all together on the ingredients?

$(0.85)(5.60)+1.79-1.50=\$5.05$

4. Ms. Allen is making trail mix. She mixes $\frac{3}{4}$ cups of raisins, $3\frac{1}{6}$ cups of granola, and $1\frac{1}{3}$ cups of mixed nuts. After mixing it all together, she separates it into servings that are each $\frac{2}{3}$ of a cup. How many servings can she make?

$\left(\frac{3}{4}+3\frac{1}{6}+1\frac{1}{3}\right)\div\frac{2}{3}$ $\quad \frac{21}{4}\div\frac{2}{3}\rightarrow\frac{21}{4}\cdot\frac{3}{2}=\frac{63}{8}$ or $7\frac{7}{8}$ servings

5. On a recent 3-day trip, Justice rented a car. He used 0.66 gallons of gas the first day, 1.38 gallons of gas the second day, and 0.86 gallons of gas the third day. The rental car company charged him $\$5.40$ per gallon of gas used. How much did Justice pay for gas?

$5.40(0.66+1.38+0.86)=5.40(2.9)=\$15.66$

Gustav is saving his money to buy a new computer. He currently has $\$318.73$ in his savings account. The table shows the occasional jobs Gustav works to earn money.

Job	Rate
Lawn-mowing	$\$12.50$ per lawn
Car-washing	$\$13.25$ per car
Babysitting	$\$16$ per hour
DJing	$\$21$ per hour

6. On Saturday, Gustav mowed 3 lawns and washed 7 cars. How much money did he make altogether on Saturday?

$$(3 \times 12.50 + 7 \times 13.25) \rightarrow 37.50 + 92.75 = \$130.25$$

7. On Sunday, Gustav babysat his cousin for 3.5 hours. Then, he DJed a party that was 2.5 hours long. How much money did Gustav make on Sunday?

$$(3.5 \times 16 + 2.5 \times 21) \rightarrow 56 + 52.50 = \$108.50$$

8. If he deposits all his income from the weekend into his savings account, how much will Gustav now have in his savings account?

$$318.73 + 130.25 + 108.50 = \$557.48$$

9. Suppose the computer Gustav wants to buy costs $\$999$. How much more does he need to save?

$$999.00 - 557.48 = \$441.52$$

10. What is a combination of jobs that Gustav could work such that he would have enough money saved to buy his computer?

Answers will vary.
