Quarter 2 Summary of Instructional Units

Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.

Unit 5 - Solving Multi-Step Problems with Proportional Relationships	With 11 lessons over 13 recommended instructional days, this unit covers benchmarks **MA.7.GR.1.5**, **MA.7.AR.3.3**, and **MA.7.AR.4.5**.

	In this unit, students will be exposed to different contexts in which proportional reasoning is applicable. Using proportional thinking, unit rates, and scale factors, students will solve problems involving scale models, convert units between measurement systems, and solve multi-step proportion problems. This unit lays the foundations for Unit 7 where students will explore how to represent proportional relationships using graphs, tables of values, equations, and written descriptions.
Unit 6 - **Relationships in Triangles**	With 8 lessons over 10 recommended instructional days, this unit covers benchmarks **MA.8.GR.1.1, MA.8.GR.1.3, MA.8.GR.1.2,** and **MA.8.GR.2.4**. In this unit students explore the Triangle Inequality Theorem, Pythagorean Theorem, and proportional relationships in similar triangles. The unit includes focus on both mathematical and real-world problems. Students will use inequalities and equations to solve problems related to theorems in triangles.
Unit 7 - **Representing Proportional Relationships**	With 7 lessons over 9 recommended instructional days, this unit covers benchmarks **MA.7.AR.4.1, MA.7.AR.4.2, MA.7.AR.4.3**, and **MA.7.AR.4.4**. In this unit, students are introduced to different representations of proportional relationships: graphs, equations, tables of values, and written descriptions. They explore these representations and learn to translate fluidly between them. Students build on their knowledge of ratios and proportions to determine the constant of proportionality in proportional relationships. Students start by graphing proportional relationships and then learn how to find the constant of proportionality from tables, graphs, equations, and written descriptions. Students expand on this understanding of proportional relationships to translate between the different representations of that relationship. At the end of this section, students should be able to translate between a graph, table of values, equation, or written description of a proportional relationship. Students will determine whether a relationship is proportional or not given any representation. This section is rich with real-world contexts, as students explore and develop an understanding of proportional relationships in context.
Unit 8 - **Relationships in Circles**	With 9 lessons over 11 recommended instructional days, this unit covers benchmarks MA.7.GR.1.3, MA.7.GR.1.4, and MA.7.DP.1.4. Instruction of this unit falls in the last weeks of Quarter 2, but will not be assessed on the Quarter 2 Benchmark Assessment. In this unit, students build on their prior knowledge and skills in determining the area of triangles, quadrilaterals, and composite figures from 6th grade to learn how to find the circumference and area of a circle. Students connect new concepts with prior knowledge through discovery of the formulas. The unit concludes with students learning to construct circle graphs to represent data, a representation they will revisit again in Unit 13.
