Quarter 3 Summary of Instructional Units

Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.

Unit 7 - Operations with Integers	With 15 lessons over 18 recommended instructional days, this unit covers benchmarks **MA.6.NSO.3.3**, **MA.6.NSO.3.4**, **MA.6.NSO.4.1**, and **MA.6.NSO.4.2**.

	A concrete-pictorial-abstract learning progression is used in Unit 7 to help students develop both a conceptual understanding of and procedural fluency with integer operations. Students initially use concrete manipulatives and pictorial representations, such as number lines and integer chips, to model integer operations. Students practice evaluating integer operation expressions. Throughout the unit, students develop an appreciation of the utility of integer operations as they solve real-world problems. The unit also includes evaluating exponents at the beginning and the end of the unit. The unit begins with introducing exponents and evaluating exponential expressions with positive bases. After students have learned all four operations with integers and developed procedural fluency, evaluating exponential expressions is revisited, this time with integer bases.
Unit 8 - Area, Surface Area, and Volume	With 12 lessons over 14 recommended instructional days, this unit covers benchmarks **MA.6.GR.2.1**, **MA.6.GR.2.2**, **MA.6.GR.2.3**, and **MA.6.GR.2.4**. In this unit, students practice geometric concepts including area, surface area, and volume with triangles, quadrilaterals, composite figures, and rectangular prisms and pyramids. Students learn how to find the missing dimensions of various shapes as well as drawing and labeling nets. From 5th grade, students build upon previous knowledge of perimeter, area, and volume of quadrilaterals and rectangular prisms. The unit starts with establishing the relationship between the area of triangles and the area of rectangles, then continues with finding the area of quadrilaterals and composite figures. Students practice various approaches to finding area of composite shapes, including decomposing into different shapes first, then finding the total area of all the decomposed shapes. Next in the unit, students explore the volume of rectangular prisms. In 5th grade, students found volume by packing three-dimensional figures with unit cubes. In this 6th grade section, students expand their understanding of volume by finding volume using several different methods, including finding volume by packing cubes with fractional edges and using the formulas $V = length \times width \times height$ and $V = (are\ of\ the\ base) \times height$. At the end of the unit, students use prior knowledge on area to find the surface area of prisms and pyramids and connect volume and surface area. This section connects the concepts of nets with that of composite figures and provides opportunities for students to draw and label nets.
Unit 9 - Data Sets	With 9 lessons over 14 recommended instructional days, this unit covers benchmarks **MA.6.DP.1.1, MA.6.DP.1.2**, MA.6.DP.1.3, and MA.6.DP.1.4. In this unit, students will discover how to classify, display, and interpret data. Students will also be interpreting data from given displays using measures of center and variation. At the beginning of the unit, students will discover the difference between numerical and categorical data and how to create statistical questions that generate data. Knowing the characteristics of a statistical question will help foster understanding of data in the rest of the unit. In relation to measures of center and variation, students find and interpret the mean, median, mode, and range for given sets of data. These lessons build on the understanding of finding mean, median, mode, and range from 5th grade and focus on interpreting real-world data. At the end of the unit, students will interpret box plots, histograms, and line plots. These lessons build on what students have learned in 5th grade using tables and line plots and focus on adding box plots and histograms to the displays students will need to interpret. Students need to have a firm understanding of how to interpret a histogram and box plot, as in the next unit students will be creating these types of graphical representations.
