

According to Florida Building Code, a parking space must be no less than 12 feet wide.

1. Write an inequality to represent the width, w , that parking spaces can be.

$$w \geq 12$$

2. Represent the inequality on a number line.

3. List two examples of possible widths, in feet, of the parking spaces.

Answers can vary. 12 ft, 14 ft.

4. Give one example of a width that is true for the inequality but does not make sense in the real world.

Answers can vary. 1,000 ft.

The maximum weight for a rider on a collapsible-floor water slide is 400 pounds.

5. If w represents the weight of the rider, write an inequality to describe all possible values of w .

$$w \leq 400$$

6. Represent the inequality on a number line.

7. Does the inequality that represents the situation include 0 as a possible weight? Why or why not?

Yes, any weight less than or equal to 400 pounds is a possible solution including zero in terms of the inequality.

8. Explain why a negative number does not make sense in this context.

A negative number does not make sense in this context because riders will not have a negative weight.

A farmer plans to plant more than 56.75 acres of lemons.

9. If L represents the number of acres of lemons the farmer plants, write an inequality that represents the number of acres the farmer plants.

$$L > 56.75$$

10. Represent the inequality on a number line.
