

Each transformation shown is a dilation of the preimage $\triangle APS$, using the same scale factor $\frac{1}{3}$ and a different center of dilation. Identify the center of dilation for each. Use the table for questions 1-5.

Transformation		Center of Dilation
1.		☐ Point A ☒ Point B ☐ Point C ☐ Point W

5. In which question is the center of dilation a point on the preimage? How do you know? **In question 2 because the image and preimage overlap.**

Each transformation shown is a dilation of the preimage Quadrilateral $ABCD$, using the same center of dilation and a different scale factor. The scale factor is listed with each transformation. Identify how the size of the image compares to the preimage.

Transformation		Change in size
6.	scale factor = $\frac{1}{3}$ 	☐ bigger ☒ smaller ☐ stays the same
7.	scale factor = 1 	☐ bigger ☐ smaller ☒ stays the same
8.	scale factor = 2 	☒ bigger ☐ smaller ☐ stays the same
9.	scale factor = 3.2 	☒ bigger ☐ smaller ☐ stays the same

10. Describe what you notice about the figures as the scale factor of the dilation changes. **The larger the scale factor, the larger the image, given the same preimage. Also, a larger scale factor moves the image farther away from the center of dilation.**
