

The table shows the relationship between household size and the annual income, in thousands of dollars.

Household Size	1	2	2	3	4	4	4	5	6	7
Annual Income in Thousands of Dollars	68	37	95	61	49	58	89	64	79	104

1. What does the number 95 represent in the bottom row?
A 2-person household has an annual income of \$95,000.
2. Circle the row title that represents the independent variable in the table, and box the row title that represents the dependent variable in the table.

The data from the table is shown as a scatter plot.

3. What is the independent variable?
Household Size
4. What is the dependent variable?
Annual Income
5. Gerald is interested in how the annual income is affected with each increase in the household size. Is the scatter plot the best graph to use? Explain why or why not?
Answers may vary. No because it shows an overall trend but not the effect from changes in each household's size.

6. Kerri is interested in the overall trend of how the household size effects the annual income. Is the scatter plot the best graph to use? Explain why or why not.
Yes, because the line of fit shows the trend over time.

The percent of paper packaging recycled and the percent of glass packaging recycled was recorded for ten different countries. The data is displayed as a line graph.

7. The variables are the percentage of paper packaging recycled and the percentage of glass packaging recycled. Determine which is the independent variable and which is the dependent variable.
independent: paper packaging recycled
dependent: glass packaging recycled
8. Derek is interested in determining how the amount of glass recycling differs between each amount of paper recycling. Explain which graph is best for him to use. **Answers or explanations may vary.**
The line graph is best because the line segments between points show the change in glass recycling between each amount of paper recycling.
9. Sam is looking to identify the overall trend in the relationship between the amount of paper recycled and the amount of glass recycled. Explain which graph is best for her to use. **Explanations may vary.**
A scatterplot would be better because the line graph shows changes between amounts of paper recycling but not the overall trend.
10. Using the graph from question 9, describe the relationship between the amount of paper recycling and the amount of glass recycling.
The amount of paper recycling seems to have no impact on glass recycling.
