

The scatter plot shows the relationship between the temperature in degrees Celsius and specific humidity in grams per kilograms (g/kg).

The data is shown, fit with three different lines.

- Which graph has the most points above the line?
Line of Fit C
- Which graph has the most points below the line?
Line of Fit A
- Which graph has an equal number of points above and below the line?
Line of Fit B

4. Explain which graph has the most accurate line of fit.
 Line of Fit B – explanations may vary.
 It has equal number of points above and below the line.

5. The point $(-10, 2)$ is on the line. Interpret this point in context.
 When the temperature was -10°C , the humidity was 2 g/kg.

The set of data shows the relationship between altitude in kilometers (km) and the temperature in degrees Celsius.

6. Use a straightedge to draw a line that models the relationship between the variables.

7. Describe the patterns of association.
 Strong negative linear association between altitude and temperature.

The set of data shows the relationship between a person's annual income in thousands of dollars and their life expectancy.

8. Use a straightedge to draw a line that models the relationship between the variables.
9. Describe the patterns of association.
 Positive linear association between income and linear life expectancy.

10. Explain what any outliers represent on this graph.
 Answers may vary.
 People who had a shorter life than expected, despite their income.
