

Grade 8
Unit 11
Lesson 5 Practice

Name _____
Date _____
Period _____

The scatter plot shows the inflation rate in the years since 1970.

1. Describe the direction of the linear association between the two variables in the scatter plot.
2. Describe the strength of the linear association between the two variables in the scatter plot.
3. Explain whether the scatter plot has any outliers.
4. Use a straightedge to draw a line that models the linear relationship between the two variables on the scatter plot.
5. Explain how the slope of your line relates to the patterns of association.

The relationship between food supply available per person, measured in calories, and life expectancy is shown in the scatter plot.

6. Describe the direction of the linear association between the two variables in the scatter plot.
7. Describe the strength of the linear association between the two variables in the scatter plot.
8. Explain whether the scatter plot has any outliers.
9. Use a straightedge to draw a line that models the linear relationship between the two variables on the scatter plot.
10. Explain how the slope of your line relates to the strength and direction of the association.
