

1. What is another equivalent expressions for $-12x(x - 4)$ using the commutative property?

$-12x(-4 + x)$ or $(x - 4)(-12x)$

For questions 2-3, complete the table. In the first two columns, write an expression to represent the width and length of the rectangle. Then, in the next two columns, express the area of the rectangle in two different ways using either multiplication or division.

2.

Rectangle			
Width	Length	Area (width $\times$ length)	Equivalent area expression
$\frac{1}{5}$	$x + 10$	$\frac{1}{5}(x + 10)$	$\frac{1}{5}x + 2$

3.

Rectangle			
Width	Length	Area (width $\times$ length)	Equivalent area expression
4	$6a + 7$	$4(6a + 7)$	$24a + 28$

For questions 4-10, rewrite each expression using the distributive property.

4. $(1.25y + 8)(0.75y)$

$$0.75y \cdot 1.25y + 0.75y \cdot 8$$

$$= 0.9375y^2 + 6y$$

5. $-21r\left(\frac{5}{7}r - \frac{1}{3}\right)$

$$-21r\left(\frac{5}{7}r\right) - (-21r)\left(\frac{1}{3}\right)$$

$$= -15r^2 + 7r$$

6. $d(d - 7)$

$$d \cdot d - d \cdot 7$$

$$d^2 - 7d$$

7. $-11s(s - 9)$

$$-11s \cdot s - (-11s)(9)$$

$$= -11s^2 + 99s$$

8. $(0.2g + 9)(10g)$

$$10g(0.2g) + 10g(9)$$

$$= 2g^2 + 90g$$

9. $\frac{7}{2}t\left(16t - \frac{3}{2}\right)$

$$\frac{7}{2}t \cdot 16t - \frac{7}{2}t\left(\frac{3}{2}\right)$$

$$= 56t^2 - 5.25t$$

10. $\frac{1}{4}(32 - m)$

$$\frac{1}{4} \cdot 32 - \frac{1}{4} \cdot m$$

$$= 8 - \frac{1}{4}m$$
