

6Ath Grade: Unit 11, Lesson 5

1. In a week, Samuel's family drank $5\frac{1}{2}$ cartons of apple juice and $4\frac{4}{5}$ cartons of orange juice. What is an expression to represent the number of cartons Samuel's family drank in the week?
2. Alexis walked east 52.4 yards and then walked another 60.3 yards north. Write the expression that represents the total distance walked by Alexis.
3. At a birthday party, Samuel ate $\frac{3}{20}$ of his birthday cake. If the cake can be represented as $1 = \frac{20}{20}$, that means we can find out how much cake is left by taking $\frac{20}{20}$ and then subtracting the amount Samuel ate. What expression represents this situation?

4. Stephon goes to the supermarket with \$75. After making his purchases, Stephon only spent $\frac{2}{5}$ of that amount. What is the expression that will help us know how much money he spent at the supermarket.
5. Delaney is making a muffin recipe that calls for $2\frac{3}{4}$ cups of sugar. Suppose Delaney only wants to make $\frac{2}{3}$ of the recipe, what expression could be written to solve for the amount of sugar she will now need?
6. Ramon transports flowers for Rolling Rosie's Garden Center. On his last job, Ramon made \$0.31 for every mile he drove. He earned a total of \$389.36. Set up a fraction to determine how many miles Ramon drove.
