

Complete each statement and model it on the number line.

1. $|9| = \underline{9}$

2. $|-3.5| = \underline{3.5}$

3. $|8.25| = \underline{8.25}$

4. $\left|\frac{7}{3}\right| = \underline{\frac{7}{3}}$

5. Martina claims that an absolute value cannot be negative. Explain whether you agree with Martina.

This is correct, distance is measured in positive units and absolute value is distance from 0.

The rational numbers -1.4 and 1.4 are opposites.

6. Complete the two statements shown and model them on the number line.

$$|-1.4| = \underline{1.4}$$

$$|1.4| = \underline{1.4}$$

7. What is the relationship between the absolute values of -1.4 and 1.4 ?

They are the same distance from 0 on the number line, so their absolute value are the same.

Consider the incomplete statement $|\underline{\quad}| = 6\frac{1}{4}$

8. Explain why there are two rational numbers that could have an absolute value of $6\frac{1}{4}$.

There are two because $6\frac{1}{4}$ and $-6\frac{1}{4}$ are equal distance from 0 on the number line.

9. Complete the statements with two different rational numbers and model them on the number line.

$$|-6\frac{1}{4}| = 6\frac{1}{4}$$

$$|6\frac{1}{4}| = 6\frac{1}{4}$$

10. Complete the statements with two different rational numbers and model them on the number line.

$$|2.9| = 2.9$$

$$|2.9| = 2.9$$
