

The landing of three arrows are plotted on a coordinate grid.

1. What is the distance between Arrow 1 and Arrow 2?
2. What is the distance between Arrow 1 and Arrow 3?
3. On which coordinate point would Arrow 4 need to land to create a rectangle?
4. If Arrow 4 creates a rectangle, what is the perimeter of that rectangle?
5. If Arrow 4 creates a rectangle, what is the area of that rectangle?

A tennis court is represented on a coordinate plane where the x -axis represents length, in feet, and the y -axis represents width, in feet.

6. What is the length of the tennis court, in feet?
7. What is the width of the tennis court, in feet?
8. What is the perimeter, in feet, of the tennis court?
9. What is the area, in square feet, of the tennis court?
10. The chair umpire sits half-way along the length of the court. What would be a coordinate point that represents the location of the chair umpire?
