

Chelsee has hired a new employee, Chip, to help her make cookies for the local hospitals. She needs to determine if Chip makes cookies faster, slower, or at the same speed than she does. The table represents the number of cookies baked hourly.

Hours	Chelsee's Cookies by Dozen	Chip's Cookies by Dozen
1	10	11
2	20	22
3	30	33
4	40	44
5	50	55

Use the table for questions 1 through 10.

1. According to the table, Chelsee bakes batches of dozen cookies at a

rate of ☒ $\frac{20}{2}$ ☐ $\frac{33}{3}$ per hour.

2. Chelsee bakes 10 dozen cookies in one hour.

3. What is Chip's rate for 3 hours?

$$\frac{33}{3}$$

4. Chip's unit rate tells you that he bakes 11 dozen cookies in 1 hour(s).

5. Chip has a ☐ slower ☒ faster unit rate than Chelsee by 1 dozen(s).

6. Complete the table using the unit rates you determined previously.

Chelsee was curious as to how her rate of baking cookies compared to Chip's rate throughout the day.

7. The ratio of the number of cookies Chelsee baked to the number of cookies that

Chip baked Chip after 4 hours is

- ☒ 40 to 44.
☐ 44 to 40.

8. After an 8-hour day, Chip baked 88 dozen cookies and Chelsee has baked 80 dozen cookies.

9. How did the unit rate change throughout the day?

It stayed constant.

10. Give some examples of why Chip could have been slightly faster, or made slightly more cookies, than Chelsee.

Answers vary.

His oven could bake the cookies faster; he could have help from another person.
