

Grade 6
Unit 12
Lesson 9 Practice

Name Answer Key
Date _____
Period _____

Write and solve an algebraic equation for each of the following.

1. Rhonda ate 8 peanut M&M's, which is 6 less than her daughter, Diana ate. How many peanut M&M's did Diana eat?

$$\begin{array}{r} m - 6 = 8 \\ +6 \quad +6 \\ m = 14 \end{array}$$

$$\text{Diana} = 14$$

$$\text{Rhonda} = 8$$

2. Cathy reviewed her monthly spending and found that she reduced her monthly spending on coffee by \$32 from the prior month. If her monthly spending on coffee was \$108, how much did she spend on coffee in the prior month?

$$\begin{array}{r} m - 32 = 108 \\ +32 \quad +32 \\ m = 140 \end{array}$$

3. Marcus gained 350 new followers on social media after his article was published. If he now has 3,425 followers, how many did he have before the article was published?

$$\begin{array}{r} f + 350 = 3425 \\ -350 \quad -350 \\ f = 3075 \end{array}$$

4. Fischer has a goal of making \$120 in tips before the end of his shift. If he already has earned \$91, how much more does he need in order to meet his goal?

$$\begin{array}{r} T + 91 = 120 \\ -91 \quad -91 \\ T = 29 \end{array}$$

5. Darlene collected 28 cans for a food drive, which was 12 less than the prior day. How many cans did she collect the prior day?

$$\begin{array}{r} C - 12 = 28 \\ +12 \quad +12 \\ C = 40 \end{array}$$

6. Bruno earned \$19.50 for washing the family car, bringing his total amount of savings to \$66.20. How much did Bruno already have saved before washing the car?

$$B + 19.50 = 66.20$$

$$-19.50 \quad -19.50$$

$$B = \$46.70$$

7. Xin ran 18.25 miles less than her friend Kelly ran last week. If Xin ran 22.9 miles, how many miles did Kelley run?

$$K - 18.25 = 22.9$$

$$+18.25 \quad +18.25$$

$$K = 41.15$$

8. After paying cash for dinner, Daniel received \$9.91 back as change. If the total of the bill was \$40.09, how much did Daniel give the waiter to pay the bill?

$$x - 9.91 = 40.09$$

$$+9.91 \quad +9.91$$

$$x = 50$$

9. Alyssa beat her high score by scoring 9,241 points more than her previous high score. If her original high score was 104,560 points, what is her new high score?

$$h = 104,560 + 9,241$$

$$h = 113,801$$

10. A streaming service recently lost 4,500 subscribers. If they originally had 92,000 subscribers, how many subscribers do they have now?

$$92,000 - 4,500 = x$$

$$x = 87,500$$
