

1. What is the inverse of division?

multiplication

2. What is the inverse of multiplication?

division

For questions 3-7, use the algebra tiles shown.

3. What expression represents the left side of the equation?

$3x$

4. What expression represents the right side of the equation?

6

5. Write the algebraic representation of the equation.

$3x = 6$

6. What operation would be used to solve the equation?

division

7. What value of x makes the equation true?

2

8. Represent the equation $8x = 16$ by drawing a model using Algebra Tiles.

A diagram representing the equation $8x = 16$ using algebra tiles. On the left, there are 8 vertical rectangles, each labeled with the variable x . These are followed by an equals sign. On the right, there are 16 small squares, each labeled with the number 1. These 16 squares are arranged in two rows of 8 squares each.

9. Represent the equation $\frac{k}{12} = -8$ by drawing a model using Algebra Tiles.

A diagram representing the equation $\frac{k}{12} = -8$ using algebra tiles. On the left, there is a large square divided into a 3x4 grid of 12 smaller squares by dashed red lines. The top-left square of this grid is labeled with the fraction $\frac{k}{12}$. This is followed by an equals sign. On the right, there are 8 small squares, each labeled with the number -1. These 8 squares are arranged in two rows of 4 squares each.

10. Represent the equation $-g = 7$ by drawing a model using Algebra Tiles.

A diagram representing the equation $-g = 7$ using algebra tiles. On the left, there is a single vertical rectangle labeled with the variable $-g$. This is followed by an equals sign. On the right, there are 7 small squares, each labeled with the number +1, arranged in a single horizontal row.
