

6Ath Grade: Unit 14, Lesson 10

1. What is a value that makes the inequality $-5x < 15$ true?
2. You have \$25 to order pizza for you and your friends. Slices of pizza are \$2.50 each. The inequality representing this scenario is $2.50n \leq 25$, with n representing the number of pizza slices you can order. What is a number that represents the maximum amount of pizza slices you can order for you and your friends?
3. Is the inequality $2x > 12$ true or false with an x value of -6?

4. What is a solution set for $-x \geq -7$?

5. Given the inequality $-k > 7$, what is an equivalent inequality?

6. When solving an inequality, what do you do when you multiply or divide by a negative number?
