

6Ath Grade: Unit 10, Lesson 3

1. What term is used to describe the number that occurs most frequently in a data set?

2. Describe the process for finding the median with an even set of data points?

3. A data set is shown. Find the median of the data set.

$\{88, 79, 99, 96, 91\}$

4. A data set consists of the following: 123, 111, 134, 121, 147. Give an example of a possible outlier, if added to the data set.

5. A data set is shown. Given the following calculation, what measure of center or measure of variation is being used?

15	18	19	23	11	27	21	20	17
----	----	----	----	----	----	----	----	----

$$Q3 - Q1 = 22 - 16 = 6$$

6. What is the interquartile range a measure of?

7. What measure has a significant effect when an outlier is included in the data?

8. With an outlier of 96, the IQR is 7 and the range is 91. Without the outlier, the IQR is 6 and the range is 8. What was changed significantly with the addition of the outlier?

9. Data values and a calculation are given. Which measure of center or spread was calculated?

51	62	64	67	70	72	74	80
----	----	----	----	----	----	----	----

$$80 - 51 = 29$$
