Quarter 2 Summary of Instructional Units	
<i>Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.</i>	
Unit 4 - Solving Problems with Rational Numbers	With 4 lessons over 7 recommended instructional days, this unit covers benchmark MA.8.NSO.1.7. In this unit, students build on their understanding of evaluating expressions with rational numbers, grouping symbols, and exponents to extend to include expressions with radicals. Students experience scaffolded learning through solving mathematical problems involving the order of operations to understand how a value is affected when operations are performed in a different order.
Unit 5A - Solving Multi-Step Problems with Proportional Relationships - Percentages	With 8 lessons over 11 recommended instructional days, this unit covers benchmarks MA.7.AR.3.1 and MA.7.AR.3.2. This unit focuses on using proportional reasoning to solve problems, including those involving percentages. Students formally learn to set up and solve proportions. Students also explore how to calculate discounts, markups, taxes, interest, percent change, percent error, and simple interest. Students also apply ratio relationships to solve real-world problems involving percentages.

Unit 5B - Solving Multi-Step Problems with Proportional Relationships - Geometry and Measurement	With 14 lessons over 16 recommended instructional days, this unit covers benchmarks MA.7GR.1.5, MA.7AR.3.3, MA.7AR.4.5, and MA.7DP.1.3 In this unit, students will be exposed to different contexts in which proportional reasoning is applicable. Using proportional thinking, unit rates, and scale factors, students will solve problems involving scale models, convert units between measurement systems, and solve multi-step proportion problems. This unit lays the foundations for Unit 7 where students will explore how to represent proportional relationships using graphs, tables of values, equations, and written descriptions. This unit also includes three lessons from the 6th Accelerated curriculum. Students will work to understand how a sample can be used to make predictions about a larger population. Students are exposed to real-world situations to truly understand scale factors in this situation. The strategies highlighted within the lessons in this section do not include setting up or solving proportions. Teachers are encouraged to model strategies like those shown in this unit as students build a stronger conceptual understanding of ratios and proportional relationships.
Unit 7 - Representing Proportional Relationships	With 7 lessons over 11 recommended instructional days, this unit covers benchmarks MA.7AR.4.1, MA.7AR.4.2, MA.7AR.4.3, and MA.7AR.4.4. Teachers may begin this unit prior to the end of Quarter 2, but none of the benchmarks will be assessed this quarter. In this unit, students are introduced to different representations of proportional relationships: graphs, equations, tables of values, and written descriptions. They explore these representations and learn to translate fluidly between them. Students build on their knowledge of ratios and proportions to determine the constant of proportionality in proportional relationships. Students start by graphing proportional relationships and then learn how to find the constant of proportionality from tables, graphs, equations, and written descriptions. Students expand on this understanding of proportional relationships to translate between the different representations of that relationship. At the end of this section, students should be able to translate between a graph, table of values, equation, or written description of a proportional relationship. Students will determine whether a relationship is proportional or not given any representation. This section is rich with real-world contexts, as students explore and develop an understanding of proportional relationships in context.
