Unit 7 - Representing Proportional Relationships	With 7 lessons over 11 recommended instructional days, this unit covers benchmarks MA.7.AR.4.1, MA.7.AR.4.2, MA.7.AR.4.3, and MA.7.AR.4.4. In this unit, students are introduced to different representations of proportional relationships: graphs, equations, tables of values, and written descriptions. They explore these representations and learn to translate fluidly between them. Students build on their knowledge of ratios and proportions to determine the constant of proportionality in proportional relationships. Students start by graphing proportional relationships and then learn how to find the constant of proportionality from tables, graphs, equations, and written descriptions. Students expand on this understanding of proportional relationships to translate between the different representations of that relationship. At the end of this section, students should be able to translate between a graph, table of values, equation, or written description of a proportional relationship. Students will determine whether a relationship is proportional or not given any representation. This section is rich with real-world contexts, as students explore and develop an understanding of proportional relationships in context.
Unit 8 - Relationships in Circles	With 9 lessons over 11 recommended instructional days, this unit covers benchmarks MA.7.GR.1.3, MA.7.GR.1.4, and MA.7.DP.1.4. In this unit, students build on their prior knowledge and skills in determining the area of triangles, quadrilaterals, and composite figures from 6th grade to learn how to find the circumference and area of a circle. Students connect new concepts with prior knowledge through discovery of the formulas. The unit concludes with students learning to construct circle graphs to represent data, a representation they will revisit again in Unit 13
Unit 9 - Surface Area and Volume	With 9 lessons over 11 recommended instructional days, this unit covers benchmarks MA.7.GR.1.1, MA.7.GR.1.2, MA.7.GR.2.1, MA.7.GR.2.2, and MA.7.GR.2.3. Unit 9 consists of a combination of four lessons from 6th Accelerated, Unit 7 as well as the five lessons designed to facilitate students in developing an understanding of surface area and volume of right circular cylinders. Students learned to find the surface area and volume of rectangular prisms and pyramids in the Grade 6 Accelerated lessons. While this is not the only unit in RAMP 6 that addresses Geometry (GR) benchmarks, Unit 9 is the only unit in which students engage with concepts of surface area and volume. In Unit 8 of this course, students were introduced to finding the circumference and area of circles. This unit builds from students’ new knowledge of the area of a circle and prior knowledge of surface area and volume to extend to three-dimensional figures with circular bases, cylinders.
Unit 10 - Linear Relationships	With 10 lessons over 12 recommended instructional days, this unit covers benchmarks MA.8.AR.3.1, MA.8.AR.3.2, MA.8.AR.3.5, MA.8.AR.3.4, and MA.8.AR.3.3. Unit 10 builds on students’ prior work in Unit 7 with the tables, graphs, and written descriptions of a proportional relationships. Students transition from learning about linear relationships in terms of constant of proportionality to determining and interpreting slope, graphing lines, and writing the slope-intercept forms of linear equations. Students work with multiple representations of linear relationships, including tables, graphs, and equations, throughout the unit. Students also interpret linear relationships in real-world contexts throughout the unit.
Unit 11A - Algebraic Expressions	With 5 lessons over 7 recommended instructional days, this unit covers benchmarks MA.7.AR.1.1 and MA.7.AR.1.2. In this unit from the 6th Accelerated curriculum, students will work with linear expressions, including adding and subtracting expressions and generating equivalent expressions using algebraic properties. Lessons 7 through 9 provide an opportunity for students to engage with adding and subtracting linear expressions with rational coefficients in meaningful ways. In Lesson 7, students use algebra tiles to explore the concept of combining like terms and connect prior knowledge from Unit 6 of forming zero pairs to eliminate terms. Next, in Lessons 8 and 9, students apply these skills to add and subtract linear expressions with rational coefficients. In Lessons 10-12, students continue to explore the concept of equivalence in algebraic expressions. Students build on their understanding of evaluating expressions to determine whether two expressions are equivalent using properties of operations. Students also explore how to use substitution to determine whether equations or inequalities comparing the value of two expressions are true.
