Quarter 2 Summary of Instructional Units

Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.

Unit 4 - Equivalent Numerical Expressions	With 11 lessons over 16 recommended instructional days, this unit covers benchmarks MA.8.NSO.1.3 and MA.8.AR.1.1. In this unit, students apply their prior knowledge and skills to evaluate and rewrite numeric and algebraic expressions with integer exponents. Students review the Laws of Exponents and develop an understanding of how to write equivalent numerical expressions with integer exponents. Next, students explore applying the Laws of Exponents
---	--

	to evaluate numerical expressions. Finally, students extend this knowledge to apply multiple Laws of Exponents to rewrite algebraic expressions with monomial bases and integer exponents.
Unit 5 - Relationships in Triangles	With 10 lessons over 12 recommended instructional days, this unit covers benchmarks MA.8.AR.2.2, MA.8.GR.1.1, MA.8.GR.1.3, and MA.8.GR.1.2. In this unit, students will start by understanding inequalities. The first section starts by reintroducing inequalities and having students determine which solutions will make the inequality true. Students then go on to apply what they know about solving two-step equations to solve two-step inequalities, ultimately being able to solve and graph the solutions to a two-step inequality. Students then use their understanding of solutions of inequalities to solve problems related to the Triangle Inequality Theorem. The unit finishes with Pythagorean Theorem, which students will use to solve mathematical and real-world problems both on and off of the coordinate plane.
Unit 6 - Linear Relationships	With 7 lessons over 10 recommended instructional days, this unit covers benchmarks MA.8.AR.3.1, MA.8.AR.3.2, and MA.8.GR.2.4. In this unit, students explore proportional relationships, slope, and similar triangles in mathematical and real-world problems. Students explore what proportional relationships look like in graphs, tables, and real-world situations. Students explore what makes a relationship proportional. Once students understand proportional relationships, they apply that understanding to determining slope of a graph. Students understand slope as the ratio of the change in y to the change in x. Students discover how to calculate slope by drawing right triangles on the graphs. The slope of the hypotenuse is calculated by determining the ratio of the heights to the bases. Students then build off the understanding of similar triangles used to determine slope to discover that the side lengths of similar triangles are proportional and their angles are equal. Finally, students learn how to find missing information in real-world problems by using similar triangles.
Unit 7 - Key Features of Linear Equations	With 9 lessons over 16 recommended instructional days, this unit covers benchmarks MA.8.AR.3.2, MA.8.AR.3.5, MA.8.AR.3.4, and MA.8.AR.3.3. Students transition from learning about linear relationships in terms of constant of proportionality to determining and interpreting slope, graphing lines, and writing the slope-intercept forms of linear equations. Students work with multiple representations of linear relationships, including tables, graphs, and equations, throughout the unit. Students also interpret linear relationships in real-world contexts throughout the unit.
