Summary of Quarter 2 Instructional Units

Units are linked to the SCPS Frameworks site. *Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter, unless otherwise stated.*

Unit 4- Key Features of Linear Functions	With 12 lessons over 15 recommended instructional days, this unit covers benchmarks MA.912.F.1.2 , MA.912.F.1.5 , MA.912.AR.2.3 , MA.912.AR.2.4 , MA.912.AR.2.5 .
--	--

	In this unit, students will identify key features of linear functions from various representations, compare key features of linear functions, and use key features to graph linear functions. Key features include slope, x-intercept, y-intercept, domain, range, and end behavior. In 8th grade Pre-Algebra, students' graphing experience was limited to equations in slope-intercept form. In Algebra 1, the students will work with linear functions in slope-intercept form, standard form, and point-slope form. The unit repeatedly scaffolds student learning of the concepts in the benchmarks. Allow students the opportunity to utilize the scaffolding as they experience mathematics and build their understanding.
Unit 5- Solving Equations	With 11 lessons over 14 recommended instructional days, this unit covers benchmarks MA.912.AR.2.1, MA.912.AR.1.2, MA.912.AR.9.1, MA.912.AR.9.6. In this unit, students will extend their learning of linear equations from basic one- and two-step equations from prior grades to multi-step equations, rearranging formulas, and systems of equations. This unit component begins by progressing students from simple equations to more complex multi-step equations, introducing methods for solving various types, including those with letters as coefficients. Students will also learn to define variables, interpret components, and ultimately write and solve real-world equations based on context. Following this, the focus shifts to systems of two linear equations, where students are introduced to the concept and taught various solving methods, such as graphing, substitution, and elimination. The component concludes as students apply their knowledge to write and solve systems of equations for real-world contexts.
Unit 6- Linear Inequalities	With 10 lessons over 18 recommended instructional days, this unit covers benchmark MA.912.AR.2.6. MA.912.AR.2.7, MA.912.AR.2.8, MA.912.AR.9.4, MA.912.AR.9.6. In this unit, students first extend their prior work with one-variable inequalities, reviewing solving and graphing solution sets on a number line, and then are introduced to compound inequalities. They will apply this knowledge by writing and solving inequalities that represent real-world contexts. Next, the focus transitions to two-variable inequalities, where students learn to graph linear inequalities in both mathematical and real-world scenarios, culminating in writing two-variable, linear inequalities for context. Finally, students advance to systems of inequalities in two variables, practicing the graphing and solving of these systems and understanding their solution sets.
