

MA.6.NSO.1.1

Benchmark

MA.6.NSO.1.1 Extend previous understanding of numbers to define rational numbers. Plot, order and compare rational numbers.

Benchmark Clarifications:

Clarification 1: Within this benchmark, the expectation is to plot, order and compare positive and negative rational numbers when given in the same form and to plot, order and compare positive rational numbers when given in different forms (fraction, decimal, percentage).

Clarification 2: Within this benchmark, the expectation is to use symbols ($<$, $>$ or $=$).

Purpose and Instructional Strategies

In previous courses, students plotted, ordered and compared fractions, including mixed numbers and fractions greater than one, with different numerators and different denominators. In previous courses, students plotted, ordered and compared multi-digit numbers with decimals up to the thousandths. In grade 6 accelerated, students plot, order and compare on both sides of zero on the number line with all forms of rational numbers. Additionally, students will rewrite positive rational numbers in different but equivalent forms, extending to all rational numbers, including repeating decimals. In future courses, students will plot, order and compare rational and irrational numbers.

- Instruction builds on the understanding of numbers from previous courses to include rational numbers. Students should understand that rational numbers are part of a larger number system, the real numbers, and that numbers from previous learning are all rational numbers. The graphic below explains the types of numbers that make up the rational number system.

- Inequality is a comparison between two values. Students should connect the words to the symbols, for example, the symbol $<$ reads “is less than” and the symbol $>$ reads “is greater than.”
- It can be helpful for students to think about the placement of rational numbers on a number line using benchmark comparison values.
 - Examples of this could include the following questions: Between what two whole numbers does the rational number fall? Is it more than half or less than halfway to the next whole number?
- Within the grade 6 benchmarks, students are only expected to convert between forms of positive rational numbers. When working with negative rational numbers, students are only expected to determine their relationship based on their relative location to each other, as can be demonstrated on a number line. This benchmark connects to MA.7.NSO.2 where students will be expected to solve problems with all rational numbers including integers in the grade 6 accelerated course.
- Having students read the comparison relationships from right to left and from left to right can help students develop flexibility of thinking and fluency with using the inequality symbols.
- When comparing negative rational numbers, it is helpful to reason through the comparisons using real-world scenarios (*MTR.7.1*).
 - For example, if Jeff owes \$12.47 and Mary owes \$6.50, most students can quickly see and understand that $-12.47 < -6.50$. Jeff has less money than Mary.
- Students should be given opportunities to order rational numbers by notating as a list (as is often done with data sets) and by notating using inequality symbols.
 - For example, when ordering from least to greatest, the set could be written as $-\frac{5}{8}, -0.33, 2, 5.8$ or as $-\frac{5}{8} < -0.33 < 2 < 5.8$.
- Instruction includes the use of technology to help define and explore rational numbers.

Common Misconceptions or Errors

- Students may think if a positive number is greater than a second positive number that the relationship will hold true given the negative or opposite of the given numbers.
 - For example, if given $6.75 > 6.71$, then a student may think that $-6.75 > -6.71$. Using a number line (vertical or horizontal) can help students to see the relationship with whole numbers, meaning the greater value is always to the right (horizontal) or above (vertical).

This relationship also holds true with rational numbers. If students accurately plot the points, they can determine which value is larger by looking at the position.
- Students may think that rational numbers cannot be compared unless they are in the same form (i.e., only fractions can be compared to fractions). Instruction should showcase how to make comparisons using benchmark values for plotting numbers without converting between forms.

Strategies to Support Tiered Instruction

- Instruction includes using a physical or digital number line where students can plot the values and see that the further to the left they move on the number line, the lesser the number.
- When comparing positive numbers in different forms, students may think they can order them just by looking, or that they cannot be compared since they are in different forms. Reviewing converting between fractions, decimals, and percent will help students in the comparing process.
- Teacher provides explanation of negative numbers (perhaps starting with integers) in terms of currency to help bring real-world connection to the standard. Students should know they would rather have someone owe them \$34 rather than someone owing them \$21. Similarly, they understand that if they owed someone \$6.25 (-6.25), that is less than owing them \$11.84 (-11.84). Then, using the number lines, students can begin to recognize patterns that will bridge their understanding from conceptual to procedural, as well as apply their understanding in real world situations.
- When plotting rational numbers, students should start by making assumptions and reasonable estimations.
 - For example, if a student is plotting $-4\frac{3}{5}$ on a number line, they need to know that $\frac{3}{5}$ is more than half. So, to graph this value, they should plot a point between -4 and -5 , with the point closer to the -5 . Then, the student can more precisely adjust the point if necessary if any other value is between -4 and -5 .
- Instruction showcases how to make comparisons using benchmark values for plotting numbers without needing to convert between forms.

Instructional Tasks

Instructional Task 1 (MTR.1.1, MTR.4.1, MTR.5.1)

Provide students with an open number line and cards labeled with different rational numbers. Students may work together in groups or individually; if individually, be sure to provide opportunities for students to discuss with a partner and as a whole group.

Part A. Arrange the cards on the number line.

Part B. Discuss your rationale for the placement of rational numbers in your group or with a partner.

Part C. Compare your work and discuss whether you agree or disagree on rational number placement on the number line.

Instructional Task 2 (MTR.6.1, MTR.7.1)

Sharon was being paid to paint a mural on a wall in the gym. The mural was supposed to be at least 6.2 feet tall and 12.8 feet wide. When she measured her completed mural, the tape measure showed the height as $6\frac{1}{4}$ feet and the width as $12\frac{7}{8}$ feet. Did the dimensions of Sharon's mural meet the given requirements? How do you know?

Instructional Task 3 (MTR.2.1, MTR.4.1)

Cameron wrote on a quiz that $\frac{2}{3}$, $-\frac{6}{8}$ and $\frac{1}{9}$ are all rational numbers because they are written as fractions and that -6 , 12% and 4.333 are not rational numbers because they are not written as fractions. Is Cameron's answer correct? Explain your reasoning using a model to represent the situation.

Instructional Items

Instructional Item 1

Plot and label each of the following numbers on a number line: 3.4 , $\frac{2}{3}$, 2.7 , 7 , $\frac{3}{4}$ and 1 .

Instructional Item 2

Write the comparisons of $-\frac{1}{6}$ and $-\frac{1}{3}$ in more than one way using words and inequalities.

Instructional Item 3

Part A. Plot -5 and 5 on a number line.

Part B. Write a comparison that describes the relationship.

**The strategies, tasks and items included in the BIG-M are examples and should not be considered comprehensive.*
