Lesson 8 Practice

Name _____
Date _____
Period _____

Josephine paid \$650 to rent a beachfront cabana at a vacation resort. For each guest that used the cabana a \$19.40 resort fee was added to the bill. If the bill was \$882.80, how many guests used the cabana?

1. What was the total amount of money spent on the cabana?
2. Which cost depends on the number of people who use the cabana?
3. Which cost is the same, regardless of how many visit the cabana?

The total cost for the cabana can be represented by the equation $882.80 = 19.40g + 650$.

4. What does the g represent in the equation?
5. What does the variable term, $19.40g$, represent in the equation?

6. What does the constant term, 650, represent in the equation?

7. Solve the equation $882.80 = 19.40g + 650$.

A local electrician charges a \$55 fee for a work order and \$78.04 per hour while they work. If the total bill was \$289.12, how many hours did the electrician work?

8. Write the equation that represents this situation using the variable h for the unknown quantity.

9. Solve the equation.

10. Explain what the solution means in this context.
