

Below is a table that represents the amount Brooks earns working at his local golf course.

| Hours Worked      | 32     | 45     | 60     | 68     | 78.5     |
|-------------------|--------|--------|--------|--------|----------|
| Income Earned(\$) | 464.00 | 652.50 | 870.00 | 986.00 | 1,138.25 |

1. If his roommate John earns \$13.25 per hour at his job, who makes more after working a total of 40 hours?
2. Use the space below to graph both Brooks's and John's hourly wage.

Cameron reads at a rate of 75 pages per hour. The number of pages Harper reads over time is listed below in the table of values.

| Time ( $x$ ) | Pages ( $y$ ) |
|--------------|---------------|
| 3            | 195           |
| 5            | 325           |
| 9            | 585           |
| 10           | 650           |

3. Who reads at a slower rate?
  
  
  
  
  
  
  
  
  
  
4. Write an equation that would show how long ( $x$ ) it would take Cameron to read ( $y$ ) number of pages.
  
  
  
  
  
  
  
  
  
  
5. Using the constant rates, if they both read for 6.5 hours, what is the difference in number of pages read?
  
  
  
  
  
  
  
  
  
  
6. How long would it take Harper to read 3,000 pages?
