

Use the following for questions 1-4.

1. On average, a whale shark eats approximately 45.6 pounds (lbs.) per day. Use this constant rate to complete the following table.

Days	1	3	5	9	12
Weight (lb)	45.6	136.8	228	410.4	547.2

2. Use the table to plot the ordered pairs on a coordinate plane.

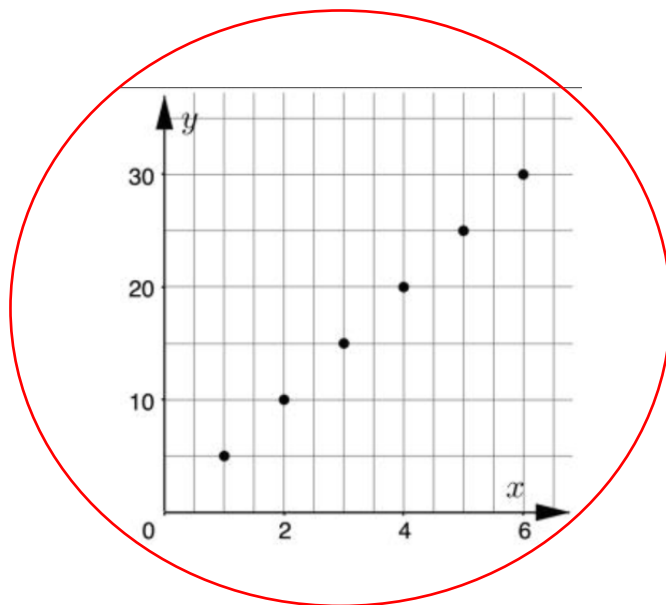

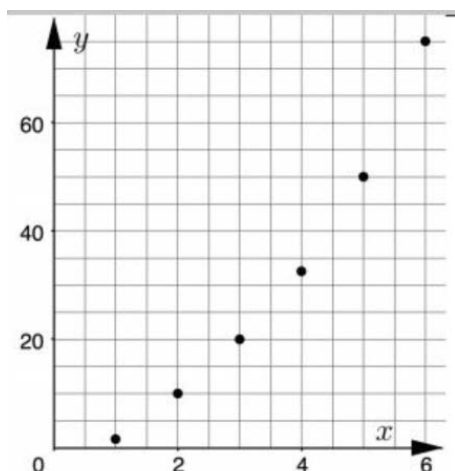

3. As your x values increase, what is happening to your y values?

The y values also increase.

4. Approximately how many pounds of food would a whale shark consume during the month of October?

$45.6(31) = 1,413.6$ pounds of food

5. Which graph shows a proportional relation?

6. What is the constant unit rate for the proportional relationship between x and y in question 5?

$$\frac{10}{2} = 5$$

7. Data is collected from a new social media site on how many videos are posted per active users each day. The data is captured in the table below.

Number of active users	Number of videos posted
42	168
14	56
92	368
153	612

Determine the constant of proportionality $\frac{y}{x}$.

$$\frac{168}{42} = 4$$
