

An Uber driver logs his gas intake for the week. This data is represented in the table below.

	x	y
Date	Gallons of gas (g)	Cost (c)
1/17/2021	16.5	57.09
1/19/2021	21.2	73.35
1/20/2021	12	41.52
1/22/2021	29.75	102.94

1. What is the constant rate?

$$\frac{y}{x} = \frac{57.09}{16.5} = \$3.46 \text{ per gallon}$$

2. In the real world, explain how this might be difficult to represent with a constant rate.

Answers may vary.

The price of gas can vary from day to day.

3. Write an equation to represent the cost for the Uber driver to fill his tank for the week.

$$y = 3.46x$$

Taylor is a part of a running group. She runs 16 miles per week. Complete the table of values below.

<i>x</i>	<i>y</i>
Number of Days	Distance
14	32
28	64
35	80
49	112

4. Using the coordinate plane below, label the *x* and *y* axis based on the table of values.

5. Graph the ordered pairs found in the table of values.
6. Based on the table of values, what is the constant rate of miles per day?

$\frac{32}{14}$ = approximately 2.3 miles per day
