

Below is a table that represents the amount Brooks earns working at his local golf course.

Hours Worked	32	45	60	68	78.5
Income Earned(\$)	464.00	652.50	870.00	986.00	1,138.25

1. If his roommate John earns \$13.25 per hour at his job, who makes more after working a total of 40 hours?

Brooks earns more as he earns \$14.50 per hour ($464 \div 32$) so his total is \$580. His friend John at \$13.25 per hour earns a total of \$530.

2. Use the space below to graph both Brooks's and John's hourly wage.

Brooks:
 $y = 14.50x$

John
 $y = 13.25x$

Cameron reads at a rate of 75 pages per hour. The number of pages Harper reads over time is listed below in the table of values.

Time (x)	Pages (y)
3	195
5	325
9	585
10	650

3. Who reads at a slower rate?

$$\text{Cameron} = 75$$

$$\text{Harper: } \frac{195}{3} = 65$$

Harper reads at a slower rate.

$$\frac{325}{5} = 65$$

$$\frac{585}{9} = 65$$

$$\frac{650}{10} = 65$$

4. Write an equation that would show how long (x) it would take Cameron to read (y) amount of pages.

$$y = 75x$$

5. Using the constant rates, if they both read for 6.5 hours, what is the difference in number of pages read?

$$y = 75x \text{ (Cameron)}$$

$$y = 75 \cdot 6.5$$

$$y = 487.5$$

$$y = 65x \text{ (Harper)}$$

$$y = 65 \cdot 6.5$$

$$y = 422.50$$

$$487.50 - 422.50 = 65$$

6. How long would it take Harper to read 3,000 pages?

$$y = 65x$$

$$\frac{3000}{65} = \frac{65x}{65}$$

$$46.154 = x$$

It would take Harper a little more than 46 hours to read three thousand pages.
