

Grade 7
Unit 6
Lesson 1 Practice

Name _____
Date _____
Period _____

Recall the exchange rates from the Mathlandia Exploration.

Exchange Rate		Unit
1 peak	0.08	sal(s)
	0.05	pop(s)
	0.06	equi(s)
	0.02	var(s)
	0.49	op(s)

For questions 1-4, determine the equivalent values for each currency exchange. If necessary, round to the nearest hundredth.

1. 37 peaks = 2.96 sals

$$\frac{1}{.08} = 37$$

2. 600 peaks = 12 vars

$$12 \div 0.02$$

3. 25 peaks = 25 peaks

4. 12 peaks = 5.88 ops

$$12(0.49)$$

5. If 10 ops are equal to 1.63 sals, how many sals are equal to a book that costs 12.25 ops?

$$\frac{10 \text{ ops}}{12.25} = \frac{1.63 \text{ sals}}{x} = 1.9967 \approx 2 \text{ sals}$$

6. Suppose 1 pop equals 1.55 sals, and 1 pop equals 18.70 peaks. If a board game costs 388.25 sals, how much does it cost in peaks?

$$\underline{4,684.05} \text{ peaks} \quad \frac{1.55 \text{ sals}}{388.25 \text{ sals}} = \frac{18.70 \text{ peaks}}{x}$$

7. Suppose 1 sal equals 0.76 equis, and 1 sal equals 5.87 ops. If a bracelet costs 9.62 equis, how much does it cost in ops?

$$\underline{74.30} \text{ ops} \quad \frac{0.76 \text{ equis}}{9.62 \text{ equis}} = \frac{5.87 \text{ ops}}{x}$$

8. Suppose 1 var equals 52.82 peaks, and 1 var equals 3.32 equis. If a cookie costs 15.12 peaks, how much does it cost in equis?

$$\underline{0.95} \text{ equis} \quad \frac{52.82 \text{ peaks}}{15.12 \text{ peaks}} = \frac{3.32 \text{ equis}}{x}$$

9. Suppose 1 op equals 0.17 sals, and 1 op equals 0.04 vars. If a soft drink costs 3.99 sals, how much do they cost in vars?

$$\underline{0.94} \text{ vars} \quad \frac{0.17 \text{ sals}}{3.99 \text{ sals}} = \frac{0.04}{x} \text{ vars}$$

10. Suppose 1 peak is equal to 0.49 ops, and 1 peak equals 0.08 sals. If a candy bar costs 2.75 ops, how much does it cost in sals?

$$\underline{0.45} \text{ sals} \quad \frac{0.49 \text{ ops}}{2.75 \text{ ops}} = \frac{0.08 \text{ sals}}{x}$$
