

Grade 7  
Unit 7  
Lesson 1 Practice

Name \_\_\_\_\_  
Date \_\_\_\_\_  
Period \_\_\_\_\_

1. Divide the circles into *fourths* and *fifths*.

2. Complete the table with the fraction and percentage of the whole circle that each congruent sector represents.

| Sector         | Fraction      | Percentage        |
|----------------|---------------|-------------------|
| <b>Thirds</b>  | $\frac{1}{3}$ | $\approx 33.33\%$ |
| <b>Sixths</b>  | $\frac{1}{6}$ | $\approx 16.67\%$ |
| <b>Eighths</b> | $\frac{1}{8}$ | 12.5%             |

Use the circle to answer questions 3-5.

3. How can the circle be divided into *one half* and *three sixths*?

I would draw a horizontal line down the middle and then draw two diagonal lines extending from this line to the edge of the circle forming 3 equal pieces on the second half of the circle.

$$\frac{1}{2} = \frac{3}{6}$$

4. What is the sum of all the fractions in the circle?

$$\frac{1}{2} + \frac{1}{6} + \frac{1}{6} + \frac{1}{6} = 1$$

5. What is the sum of all the percentages in the circle?

100%

For each circle division write the central angle measure and the ratio of angle measure to  $360^\circ$ .

6. Circle Division: *Halves*

Central Angle Measure:  $\underline{180^\circ}$  Ratio of angle:  $\frac{180}{360} = \frac{1}{2}$

7. Circle Division: *Fourths*

Central Angle Measure:  $\underline{90^\circ}$  Ratio of angle:  $\frac{90}{360} = \frac{1}{4}$

8. Circle Division: *Sevenths*

Central Angle Measure:  $\approx \underline{51.4^\circ}$  Ratio of angle:  $\frac{51.4}{360} = \frac{1}{7}$

9. Circle Division: *Eighths*

Central Angle Measure:  $\underline{45^\circ}$  Ratio of angle:  $\frac{45}{360} = \frac{1}{8}$

10. Circle Division: *Ninths*

Central Angle Measure:  $\underline{40^\circ}$  Ratio of angle:  $\frac{40}{360} = \frac{1}{9}$
