

Grade 7
Unit 7
Lesson 5 Practice

Name _____
Date _____
Period _____

1. A store is having a storewide $\frac{1}{4}$ off sale. What is the amount saved on an item that costs \$8.42?

$$\text{\$}8.42 \times \frac{1}{4} \approx \text{\$}2.11$$

2. John bought a dented refrigerator because it was discounted $\frac{7}{20}$ off the original price of \$826. What was the reduced price, in dollars?

$$\text{\$}826 \times \frac{7}{20} = \text{\$}289.10 \text{ off original price}$$

$$\text{\$}826 - \text{\$}289.10 = \text{\$}536.90 \text{ is the reduced price.}$$

3. A used laptop sells for \$350. The laptop was marked up 63% before selling it. What was the wholesale cost of the laptop?

$$\frac{x}{1} = \frac{350}{1.63}$$

$$\text{\$}350 \div 1.63 = \text{\$}214.72 \text{ wholesale cost}$$

4. The owner of a fast-food restaurant chain spends \$4.75 making a burger and then adds 110% markup to sell the burger. Calculate the selling price of the burger.

$$\text{\$}4.75 \times 1.1 = \text{\$}5.23 \text{ markup}$$

$$\text{\$}4.75 + \text{\$}5.23 = \text{\$}9.98 \text{ is the selling price of the burger.}$$

5. A company produces an item for \$168.75. The item is then marked up 66%. What is the selling price of that item?

$$\text{\$}168.75 \times 0.66 \approx \text{\$}111.38 \text{ markup}$$

$$\text{\$}168.75 + \text{\$}111.38 = \text{\$}280.13 \text{ is the selling price.}$$

6. A clothing store sells a t-shirt for \$17.30, which is 18% off the original price. Calculate the original price of the t-shirt.

$$1 - 0.18 = 0.82$$

$$\frac{17.30}{x} = \frac{82}{100}$$

$$\frac{1730}{82} = \frac{82x}{82}$$

$$21.10 \approx x \rightarrow \text{original price: } \$21.10$$

7. A skateboard is 25% off and with a sale price of \$37.60. What is the original price of the skateboard?

$$1 - 0.25 = 0.75$$

$$\frac{37.60}{x} = \frac{75}{100}$$

$$\frac{75x}{75} = \frac{3760}{75}$$

$$x \approx 50.13 \rightarrow \text{original price: } \$50.13$$

8. The price of a new catchers' equipment bag is \$280.67. If it is 18% off, how much is the total cost?

$$\$280.67 \times 0.18 \approx \$50.52 \text{ off}$$

$$\$280.67 - \$50.52 = \$230.15 \text{ is the total price}$$

9. A store sells BMX bicycles for \$589.75 after a $\frac{2}{10}$ markup. How much is the markup?

$$1 + \frac{2}{10} = \frac{12}{10} = 1.2$$

$$\frac{\$589.75}{x} = \frac{1.2}{1}$$

$$\frac{\$589.75}{1.2}$$

$$x \approx \frac{589.75}{1.2}$$

$$x \approx 491.46$$

$$491.46 + m = 589.75$$

$$m = \$98.29 \text{ is the markup}$$

10. A restaurant sells its famous soup for \$3.76. The restaurant added a markup of $\frac{17}{10}$ to the cost of the soup. Find the cost of how much the restaurant pays for making the soup.

$$1 + \frac{17}{10} = \frac{27}{10} = 2.7$$

$$\frac{\$3.76}{x} = \frac{2.7}{1}$$

$$x = \frac{3.76}{2.7} \approx 1.39$$

$$\text{It costs } \$1.39 \text{ to make the soup.}$$
