Quarter 2 Summary of Instructional Units

Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.

Unit 4 - Understanding Rational Numbers	With 12 lessons over 17 recommended instructional days, this unit covers benchmarks MA.6.NSO.1.1, MA.6.NSO.1.2, MA.6.NSO.1.3, and MA.6.NSO.1.4. In this unit, students are introduced to negative rational numbers. They learn how to plot, order, compare, and find opposites of rational numbers. This is students’ first formal introduction to negative numbers, extending the number line and their knowledge of performing operations, comparing positive values, and interpreting the
---	--

	meaning of rational numbers in various contexts. Students are also introduced to absolute value for the first time, including interpreting its meaning in various contexts and using absolute values to solve problems.
Unit 5 - The Coordinate Plane	With 8 lessons over 15 recommended instructional days, this unit covers benchmarks MA.6.GR.1.1, MA.6.GR.1.1, and MA.6.GR.1.3. In this unit students extend their understanding of horizontal and vertical number lines to make connections to the coordinate plane and plot points in all four quadrants of the coordinate plane. Students then begin finding distance between two points on the coordinate plane which share an x- or y-coordinate. This includes both points with rational number coordinates and points on opposite sides of the x- or y-axis. Students find these distances both by analyzing the points plotted on a graph and by writing expressions with absolute value. Finally, students are able to build on this learning and use distance on the coordinate plane to find side lengths of rectangles, in turn being able to find area and perimeter on the coordinate plane.
Unit 6 - Ratios and Rates	With 12 lessons over 17 recommended instructional days, this unit covers benchmarks MA.6.AR.3.1, MA.6.AR.3.2, MA.6.AR.3.3, MA.6.AR.3.4, and MA.6.AR.3.5. While ratios and rates are new to 6th grade students, the work that they will do with them is very closely related to the work students have previously done with fractions, especially representing the division of two quantities as a fraction and their work with equivalent fractions. Students extend this interpretation of a fraction to represent a part-to-whole relationship between two quantities as a ratio while also learning that ratios can be used to represent part-to-part relationships as well. Students learn different ways of representing a ratio, including $a:b$, a to b, or $\frac{a}{b}$. The unit introduces ratios using a variety of visual models and with activities that explore and compare quantities in real-world contexts. Students learn and explore a variety of representations in this unit to develop a strong foundational understanding of these concepts and to increase entry points for all students. Their knowledge of ratios sets the foundation that extends to understanding proportional relationships (Grade 7) and linear relationships (Grade 8).
