Quarter 2 Summary of Instructional Units

Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.

Unit 5 - Ratios and Rates	With 11 lessons over 17 recommended instructional days, this unit covers benchmarks MA.6.AR.3.1, MA.6.AR.3.2, MA.6.AR.3.3, MA.6.AR.3.4 and MA.6.AR.3.5. While ratios and rates are new to 6th grade students, the work that they will do with them is very closely related to the work students have previously done with fractions, especially representing the division of two quantities as a fraction and their work with equivalent fractions. Students extend this interpretation of a fraction to represent a part-to-whole relationship between two quantities as a ratio while also learning that ratios can be used to represent part-to-part relationships as well. Students learn different ways of representing a ratio, including $a:b$, a to b, or $\frac{a}{b}$. The unit introduces ratios using a variety of visual models and with activities that explore and compare quantities in real-world contexts. Students learn and explore a variety of representations in this unit to develop a strong foundational understanding of these concepts and to increase entry points for all students. Their knowledge of ratios sets the foundation that extends to understanding proportional relationships (Grade 7) and linear relationships (Grade 8).
Unit 6 - Operations with Integers	With 13 lessons over 15 recommended instructional days, this unit covers benchmarks MA.6.NSO.3.3, MA.6.NSO.3.4, MA.6.NSO.4.1 and MA.6.NSO.4.2. A concrete-pictorial-abstract learning progression is used in Unit 6 to help students develop both a conceptual understanding of and procedural fluency with integer operations. Students initially use concrete manipulatives and pictorial representations, such as number lines and integer chips, to model integer operations. Students practice evaluating integer operation expressions. Throughout the unit, students develop an appreciation of the utility of integer operations as they solve real-world problems. The unit also includes evaluating exponents at the beginning and the end of the unit. The unit begins with introducing exponents and evaluating exponential expressions with positive bases. After students have learned all four operations with integers and developed procedural fluency, evaluating exponential expressions is revisited, this time including integer bases.
Unit 7 - Area	With 8 lessons over 12 recommended instructional days, this unit covers benchmarks MA.6.GR.2.1, MA.6.GR.2.2, MA.7.GR.1.1, and MA.7.GR.1.2. In this unit, students build on their prior knowledge and skills from Grade 5 in determining the area and perimeter of rectangles to derive the formula for the area of a triangle. Students then learn to find the areas of special quadrilaterals, composite figures, and polygons by decomposing figures into rectangles and triangles. Throughout the unit, students connect new concepts with prior knowledge as they discover the formulas for finding areas of various figures and then use them to solve problems.
