Quarter 1 Summary of Instructional Units

Units are linked to the SCPS Frameworks site. Bolded benchmarks are assessed on the current quarter assessment. The benchmarks that are not in bold may be assessed in the following quarter.

Unit 1 - Introduction	With 6 lessons over 12 recommended instructional days, this unit covers benchmarks MA.6.DP.1.1, MA.6.DP.1.4, MA.6.AR.3.1, MA.6.AR.3.2, MA.6.AR.3.4, MA.6.NSO.1.1, MA.6.NSO.1.2, MA.6.NSO.1.3, MA.6.NSO.4.1, MA.6.NSO.4.2, MA.6.AR.2.2, and MA.6.AR.2.3. This unit is not included on the Benchmark Assessment because the benchmarks covered are below grade level. Unit 1 provides an opportunity to review and expand on foundational benchmarks learned in 6th Grade Math, from statistics including a variety of representations, to solving equations in the real world.
Unit 2 - Probability	With 9 lessons over 13 recommended instructional days, this unit covers benchmarks MA.7.NSO.1.2, MA.7.DP.2.1, MA.7.DP.2.2, MA.7.DP.2.3, and MA.7.DP.2.4. In this unit, students will explore probability in a variety of ways. In Section 1, students will explore how to find the sample space of a simple experiment. Students learn that in order to determine the sample space of a simple experiment they must find all the outcomes that are possible and write them as a set or list. This idea will be important in Section 3 when students learn how to find the probability of an event in a simple experiment.

	Next in Section 2, students start by reviewing how to convert between terminating decimals, fractions, and percentages. This is 6th grade benchmark, 6.NSO.3.5, that students will need to apply in order to move onto the next part of the lesson. Following the review, students will be introduced to repeating decimals and learn how to convert from fractions to repeating decimals and from repeating decimals to fractions. Ultimately, in Section 3, students apply what they have learned to finding the probability of simple experiments. Students start with an introduction to probability and the likelihood of an event occurring. Students will learn that probability is on a scale from 0 to 1 and can be expressed as a decimal, fraction, or percentage. Students will also learn how to describe an event using its likelihood. Once students have an understanding of finding simple probability of an event, they learn the difference between theoretical and experimental probability. This is done through performing a series of experiments and simulations.
Unit 3 - Operations with Rational Numbers	With 8 lessons over 12 recommended instructional days, this unit covers benchmarks MA.7.NSO.2.2 and MA.7.NSO.2.3. In Unit 3, students begin working on their fluency with operations with rational numbers in mathematical contexts. Students then extend this to problem solving in real-world contexts with all rational numbers. In Grade 6, students were focused on fluency with operations with positive rational numbers and with integers, as well as problem solving in real-world contexts with these numbers. This unit supports students who may have struggled with fluency in grade 6 while extending that fluency to include all rational numbers. In Section 1 of this unit, students will be exposed to operations with rational numbers written as numeric expressions. Many of the problems that students will solve involve performing operations given just two rational numbers. Section 1 also engages students in finding the absolute value and applying the order of operations. In Sections 2 and 3 of the unit, students will be solving problems that involve more than one operation. Sections 2 and 3 also expose students to operations with rational numbers in a wide variety of real-world problems.
