

Grade 6 Accelerated
Unit 10
Lesson 8 Homework

Name Answer Key
Date _____
Period _____

Scenario 1: Imagine a market researcher surveys 65 people on their coffee-drinking habits. He wants to know whether people in the local region are willing to switch their regular drink to something new.

1. In this scenario, what is the sample?

65 people surveyed

2. In this scenario, what is the population?

People in the local region

Scenario 2: Jasmine wants to collect data on the favorite dessert by young people in Jacksonville, FL. She decides to go outside a local store and ask every person who comes into the store during the morning and afternoon about their dessert preferences.

3. What is the population?

Young people in Jacksonville, FL

4. What is the sample?

People who go to the local store during the morning and afternoon

5. Explain why a sample chosen in this way may not be representative of the population.

People who go to the store would include all ages, not just young people.

Scenario 3: John is going to sell lemonade outside his house and save money in order to buy a new laptop. He wants to predict his sales and estimate how many days he must sell lemonade. He is considering three different methods for surveying a sample. Describe the benefits and problems with each of the possible survey methods.

Answers may vary.

6. Ask everyone in his class if they like lemonade and how much will they drink in a day.

A benefit is that his classmates have a variety of wants. A problem is that his classmates are not a representative sample of people he is selling lemonade to outside his house.

7. Ask all people younger than 15 around his house if they like lemonade and how much will they drink in a day.

A benefit is that there will be a variety of wants.
A problem is this is not a representative of the population of all ages buying lemonade.

8. Ask all neighbors around his house if they like lemonade and how much will they drink in a day.

A benefit is that this is representative of the population of people buying lemonade.
A problem is that it does not incorporate people passing by who are not neighbors.

9. Explain which of the methods from questions 6, 7, and 8 would be the most likely to produce a sample that is representative of the population.

Asking all neighbors would be the most likely to produce a representative sample.

10. Determine a better way to select a sample for this study.

Ask every 5th person who passes by his house for one week.
