

6Ath Grade: Unit 2, Lesson 4

1. A case of water contains 24 packs and each case costs \$4.99. To determine the total cost based on the number of cases purchased, what operation would be used?
2. An elementary school is giving each of its 1,240 students an equal amount of flyers to give out to encourage attendance at the upcoming school carnival. Is the question “How many flyers does each student get if there are 3,720 total flyers available” an appropriate question for this scenario? Explain.
3. After a birthday party, the unconsumed sodas from the outdoor party space and the indoor party space were combined into one cooler. What operation would be used to determine the total number of sodas in the new cooler?
