

Grade 6 Accelerated
Unit 2
Lesson 6 Practice

Name Answer Key
Date _____
Period _____

Ariana works as a barista at The Ground Bean. On Saturday, she worked 6.5 hours, and she earns \$16.80 per hour. Over the course of the day on Saturday, she also made \$32.75 in tips.

1. What operations are needed to determine the total amount of money Ariana made at her job on Saturday?

Multiplication and addition

2. Write a numeric expression to determine the total amount of money Ariana made at her job on Saturday.

$$6.5(16.80) + 32.75$$

3. Determine the total amount of money Ariana made at her job on Saturday.

$$109.20 + 32.75 = \$141.95$$

Ms. Hernandez is making a big batch of hot chocolate. She mixes $3\frac{2}{3}$ cups of melted chocolate with $5\frac{1}{4}$ cups of hot milk. Each serving of hot chocolate is $\frac{5}{6}$ cups.

4. What operations are needed to determine the number of servings Ms. Hernandez is making?

Addition and division

5. Write a numeric expression that can be used to determine the number of servings Ms. Hernandez is making.

$$(3\frac{2}{3} + 5\frac{1}{4}) \div \frac{5}{6}$$

6. Gillian went to the grocery store and bought 2.4 pounds of hamburger meat for \$6.95 per pound. She paid with a \$20 bill. How much change did she receive?

$$20 - 2.4 \times 6.95$$

$$20 - 16.68 = \$3.32$$

7. Suppose Gillian thought she should get \$10.65 in change because $2.4 + 6.95 = 9.35$ and $20 + 9.35 = 10.65$. Explain to Gillian why she is incorrect.

Answers may vary. 2.4 is not money, it is the weight of the meat.

8. For the first 15 days in January, there was a total of $8\frac{3}{8}$ inches of snow in Chicago. On the 16th, it snowed $\frac{2}{5}$ of an inch every hour for 4 hours. What was the total snowfall for the first 16 days in January?

$$8\frac{3}{8} + 4 \times \frac{2}{5}$$

$$\frac{67}{8} + \frac{8}{5} \rightarrow \frac{335}{40} + \frac{64}{40} = \frac{399}{40} = 9\frac{39}{40} \text{ inches}$$

9. Explain why your answer to question 8 makes sense.

Answers will vary.

10. Marcello bought a plant that was 5.24 centimeters tall. If it grows approximately 0.22 centimeters per day, how many days will it be before the plant is 7 centimeters tall?

$$7 - 5.24 = 1.76$$

$$1.76 \div .22 = 8 \text{ days}$$
