

Grade 6 Accelerated
Unit 3
Lesson 9 Homework

Name _____
Date _____
Period _____

The freezing point is 0°C . In December in Chicago, Illinois, the average high temperature is 3°C above freezing and the average low temperature is 4°C below freezing.

1. Write the values that represent the average high temperature and the average low temperature in Chicago in December.

Description	Value
Average high temperature	
Average low temperature	

2. Model the two values on the number line.

3. Write a mathematical statement using absolute value that could be used to find the difference between the average high and average low temperatures.
4. What is the difference between the average high temperature and the average low temperature?
5. Write a mathematical statement using absolute value that could be used to determine how much farther from freezing the average low temperature is than the average high temperature.
6. How much farther from freezing is the low temperature than the high temperature?

Allan withdrew money from his bank account three times last week. Each time, the transaction on his bank statement said $-\$40$.

7. Write a mathematical statement using absolute value that could be used to determine the total amount of money Allan withdrew last week.

8. What is the total amount of money Allan withdrew last week?

A dolphin and a turtle are both swimming. The dolphin is 6 feet below sea level, and the turtle is 31 feet below sea level.

9. Write a mathematical statement using absolute value that could be used to determine how much farther from sea level the turtle is than the dolphin.

10. How much farther from sea level is the turtle than the dolphin?
