

The histogram summarizes the lengths, in feet (ft), of a group of adult female sharks.

- How many sharks are between 16.5 and 17 feet?
4
- How many sharks measured are less than 15 feet?
16
- What is the smallest possible length of a shark in this data set?
13 ft
- Are there more female sharks measuring less than 15.5 feet or more than 15.5 feet?
More female sharks measuring less than 15.5 ft.
- If sharks younger than adult age were added to the sample, hypothesize what would happen to the spread of the data?
It would become skewed because there'd be more data at 13 feet and under.

In a study of wild bears, researchers measured the weights, in pounds (lb.) of 143 wild bears that ranged in age from newborn to 15 years old. The data was used to make the histogram shown.

6. Is it possible that the sample contains a bear that weighs 50 pounds?
Yes
7. More than half of the bears weigh less than 200 pounds in this study.
8. Mark an "M" above the bar that contains the approximate median.
9. Mark an "L" above the bar that contains the bear that weighs the least.
10. Which single range of weights has the most bears?
100 – 150
