

Grade 6 Accelerated
Unit 10
Lesson 5 Homework

Name Answer Key
Date _____
Period _____

The line plots below show the number of hours the students in three different classes spend watching videos on the internet each week.

Time (in hours)

- Which line plot shown has a center of data that is greater than the center of data for Mr. Kirk's class?
Mr. Jones's class
- The value of the largest mean number of hours of all three classes is 18.25.
- The value of the largest median number of hours of all three classes is 18.5.
- Which of the line plots shown has the most variability in the times spent watching videos on the internet? **Mr. Crawford's class**
Jones: $21 - 14 = 7$
Crawford: $20 - 11 = 9$
Kirk: $20 - 16 = 4$
- Based on the data from the line plots shown, which class spends the most time watching videos on the internet each week?
Explanation may vary.
Because his class has the highest mean and median, Mr. Jones's class spends the most time watching videos on the internet each week.

The two histograms show height distributions of 50 male professional basketball players and 50 male professional baseball players, in inches (in).

Height (in.)

6. The group with the larger center of data is basketball players.
7. The group with the larger range of heights is basketball players.
8. In one to two sentences use the words shape, center, and variability to describe the differences between the two histograms. **Answers may vary.**
Baseball: slightly left skewed with majority between 70 – 74
Basketball: has outliers which creates a greater range and is asymmetric

The box plots shown below are the mile times for a JV and Varsity volleyball team.

9. Calculate and describe how the centers compare between the two teams.
JV median: 5.25 min.
Varsity median: 4.5 min.
Varsity has a lower median mile time than JV.
10. Which team has the bigger variability? Explain your reasoning.
Varsity's Range (1.75) and IQR (≈ 1.25) are larger than JV's range (1.5) and IQR (≈ 1.1)
