

6Ath Grade: Unit 12, Lesson 2

1. What is a value of x that makes the given proportion true:

$$\frac{22}{28} = \frac{x}{112}$$

2. Suppose it takes a monkey 20 minutes to eat 1.5 pounds (lbs.) of peanuts. The proportion $\frac{20}{1.5} = \frac{90}{x}$ can be used to determine the amount of peanuts, in pounds, the monkey can eat in 90 minutes. What scale factor must be multiplied to both the numerator and denominator on the left side of the equal sign in order to determine x , the number of pounds of peanuts that this monkey can eat in 90 minutes?
3. A scale model of a building has a width of 8 inches (in.) and a height of 18 in. The actual width of the building is 480 feet (ft). The proportion $\frac{8}{18} = \frac{480}{x}$ represents the relationship between the scale drawing and the building. What is the actual height of the building??
