Unit 12
Lesson 3 Practice

Name _____
Date _____
Period _____

Solve each problem using proportional reasoning. Show your work.

For questions 1-2, use the following scenario:

A recipe for salad dressing calls for 3 parts oil for every 1 part vinegar.

1. How many tablespoons (tbsp) of vinegar are needed to make $\frac{1}{2}$ cup of salad dressing? 1 cup = 16 tbsp

2. How many tablespoons of oil are needed to make $\frac{1}{2}$ cup of salad dressing?

3. The retail price of grapes is \$2.17 per pound. If a customer paid \$8.68 for grapes, how many pounds did she buy?

4. Gregg and Dan are moving boxes. Gregg can move 7 boxes every half hour. Dan can move 10 boxes every half hour. How many hours will it take Gregg and Dan to move all 85 boxes?

For questions 5-7, use the following scenario:

A recipe for sparkling orange punch calls for $\frac{1}{2}$ gallon of orange sherbet, 6 ounces of frozen orange juice concentrate, and 2 quarts of ginger ale. Mei uses 3 gallons of orange sherbet to make punch for her party.

5. How much ginger ale does Mei need to use for her punch?

6. How much frozen orange juice concentrate does Mei need to use for her punch?

7. By what factor did Mei scale the recipe up?

For questions 8-10, use the following scenario:

A teacher is planning a field trip to a theme park. For every 6 students, the teacher must have 1 chaperone.

8. What is the ratio of students to total people on the field trip?

9. If the teacher purchased 105 total tickets, how many tickets were for students?

10. If the teacher purchased 63 total tickets, how many tickets were for chaperones?
