

1. During a baseball game, one of the players hit a homerun. The height, in feet (ft), of the baseball over time t , in seconds, is modeled using the function $b(t) = 5.5 - \frac{1}{16}t^2$. What is the initial height?
2. A student throws a paper airplane across the cafeteria. The height in feet (ft) of the paper airplane over time t , in seconds, is modeled using the function $p(t) = 4 - \frac{1}{9}t^2$. What does $p(0)$ represent?
3. At the top of a cliff, a cannonball is shot to the sea. The height in feet (ft) of the cannonball over time t , in seconds, is modeled using the function $h(t) = 20 - 4t^2$. What is the initial height of the cannonball?
