

Algebra 1: Unit 2, Lesson 9

1. Simplify the expression $\frac{18xy^6}{9y^3} + \frac{3x}{9y^3}$.

2. When the greatest common factor, k^5 , is factored out of the expression $6k^7 + 5k^5$, what is the quotient?

3. An area model of $(18m^5 + 12m^3 - 6m) \div 3m$, where $m \neq 0$, is shown.

	$6m^4$	$4m^2$	-2
$3m$	$18m^5$	$12m^3$	$-6m$

Using the area model, what is the quotient of $(18m^5 + 12m^3 - 6m) \div 3m$, where $m \neq 0$?
