1. Solve the system of equations using elimination.

$$\begin{cases} 3x + 6y = 18 \\ -3x + 4y = 2 \end{cases}$$

2. Verify the solution from question 1 algebraically using substitution.

3. Solve the system of equations using elimination.

$$\begin{cases} 2x - 7y = 10 \\ 4x + 7y = 20 \end{cases}$$

4. Verify the solution from question 3 algebraically using substitution.

5. Solve the system of equations using elimination.

$$\begin{cases} 2x - 4y = -12 \\ x + 3y = 9 \end{cases}$$

6. Verify the solution from question 5 algebraically using substitution.

7. Solve the system of equations using elimination.

$$\begin{cases} 3x - 4y = -14 \\ 2x - 6y = 8 \end{cases}$$

8. Verify the solution from question 7 algebraically using substitution.

9. Solve the system of equations using elimination.

$$\begin{cases} 3x + 4y = 6 \\ -2x + 4y = 1 \end{cases}$$

10. The graph of the system from question 9 is shown below. How can the graph be used to verify the solution to the system?
